Security

Compatibility

Lack of Architectural Concerns

Poor service abstraction

Business concepts not correctly isolated and abstracted.

Business rules spread over different systems, and little to no code reuse

Unmanageable dependencies

Systems not isolated from each other.

Updating or replacing a system has a cascade effect on other systems.

Inflexible and slow-moving legacy systems

Adapting legacy systems to business changes may be difficult.

Changes in complex and inflexible systems can take a long time.

Spaghetti Architecture

Less flexible and more difficult to manage

Why Is Architecture Important?

Drives Consensus

Manages Complexity

Reduces Risk

Supports Planning

Facilitates Change

Reduces Costs
