

Integration Patterns

Direct Integration

Cold Cache

Mobile Sync Offline Data

Transparency Services

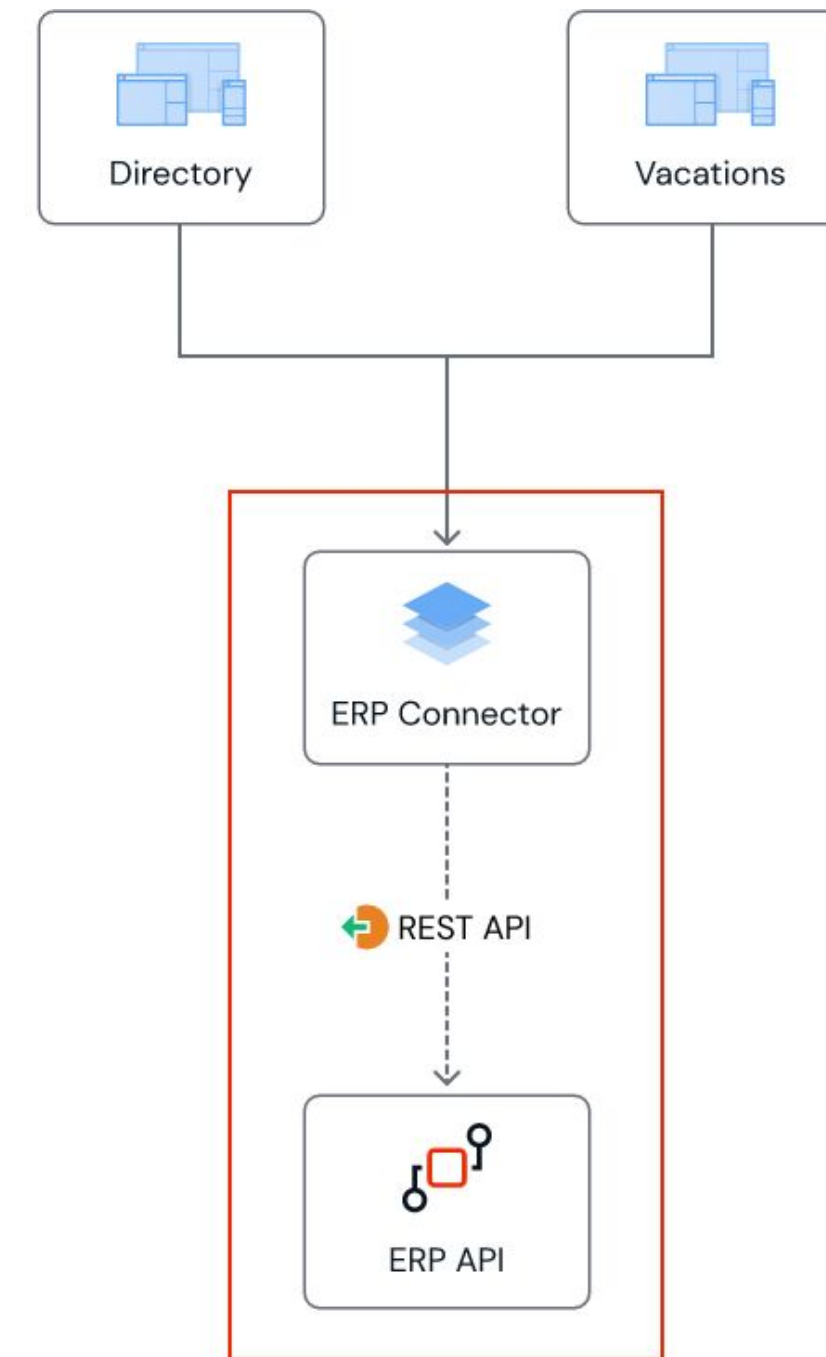

Integration Service Wrappers

Integration Service Wrappers promote **reusability** across apps and **reduce** third-party change impacts.

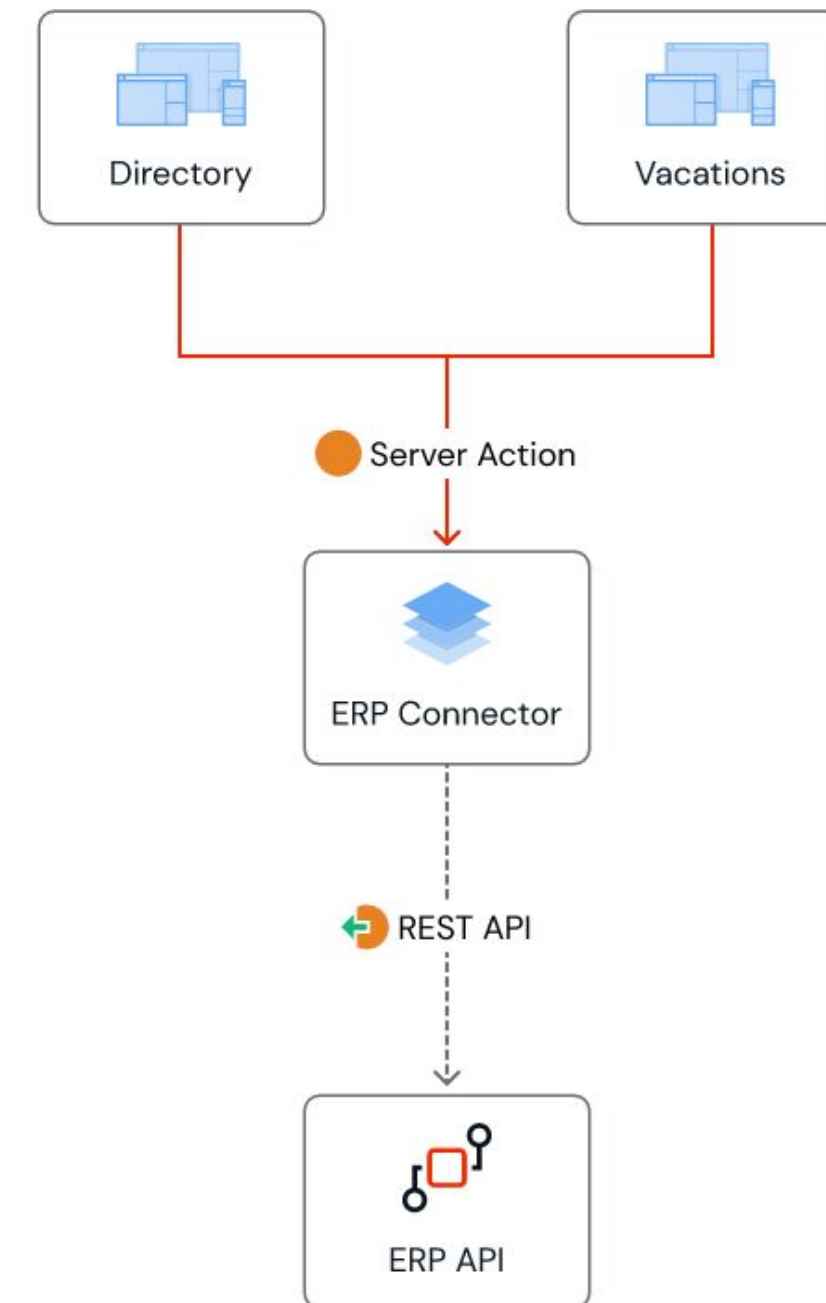

Direct Integration

- Encapsulates implementation details
 - Black box approach
- Synchronous communication
 - Real time data scenarios

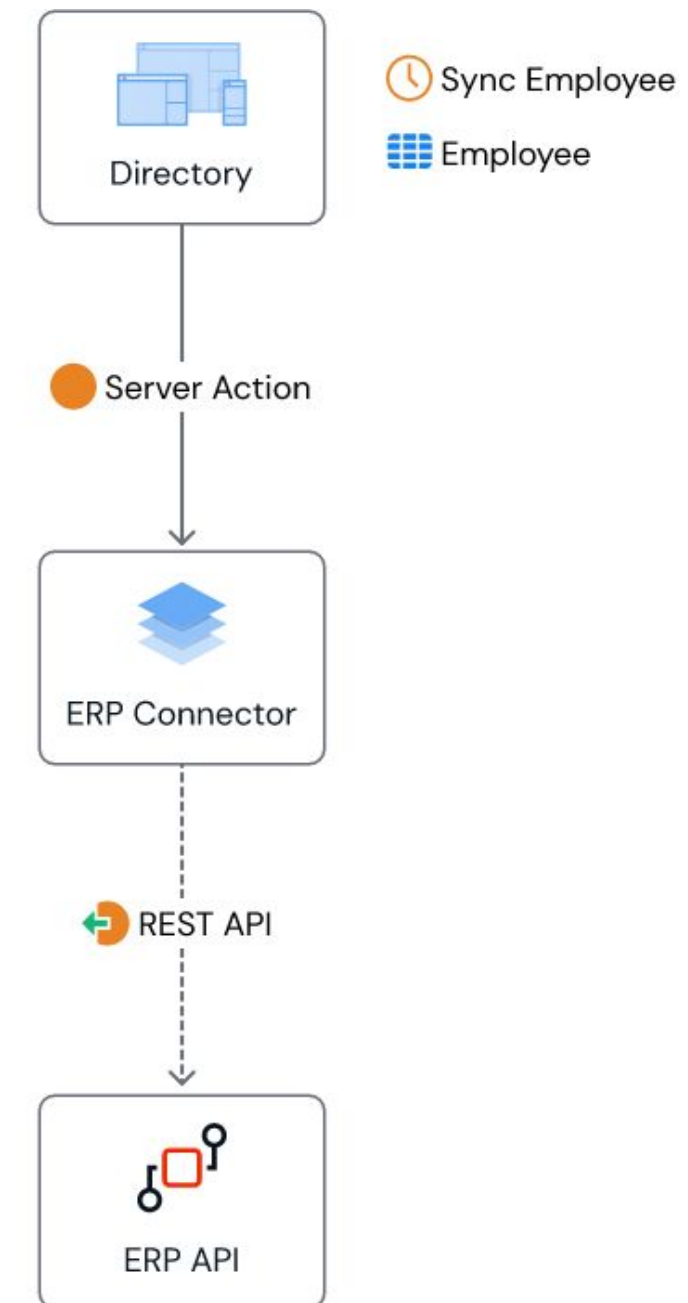

Direct Integration

- Encapsulates implementation details
 - Black box approach
- Synchronous communication
 - Real time data scenarios
- Strong dependencies between library and consumers

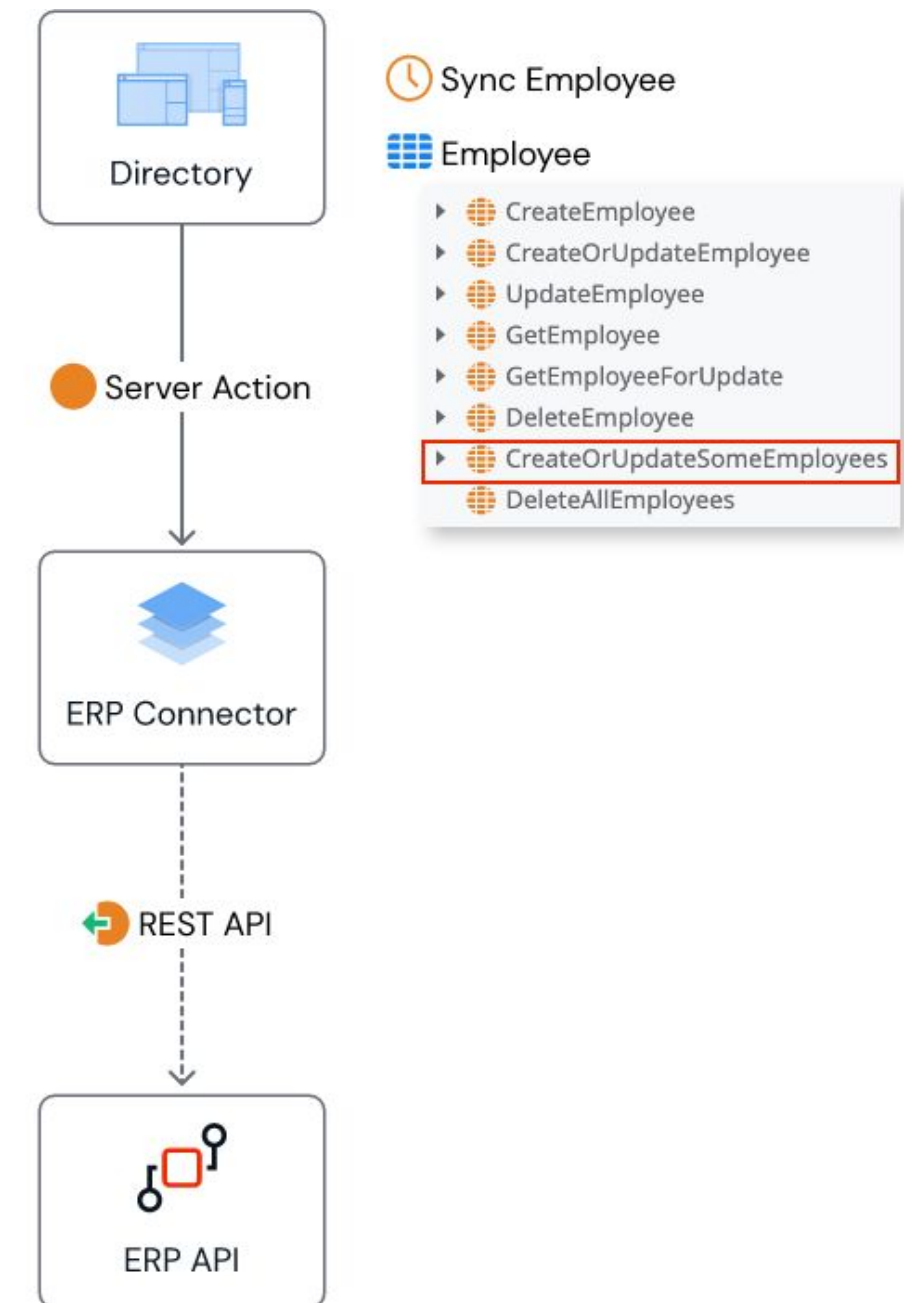

Integration with Cold Cache

- Create Entities in the consumer app
 - Hold data as needed
- Timer that runs frequently
 - Gets data
 - Populates the cache

Integration with Cold Cache

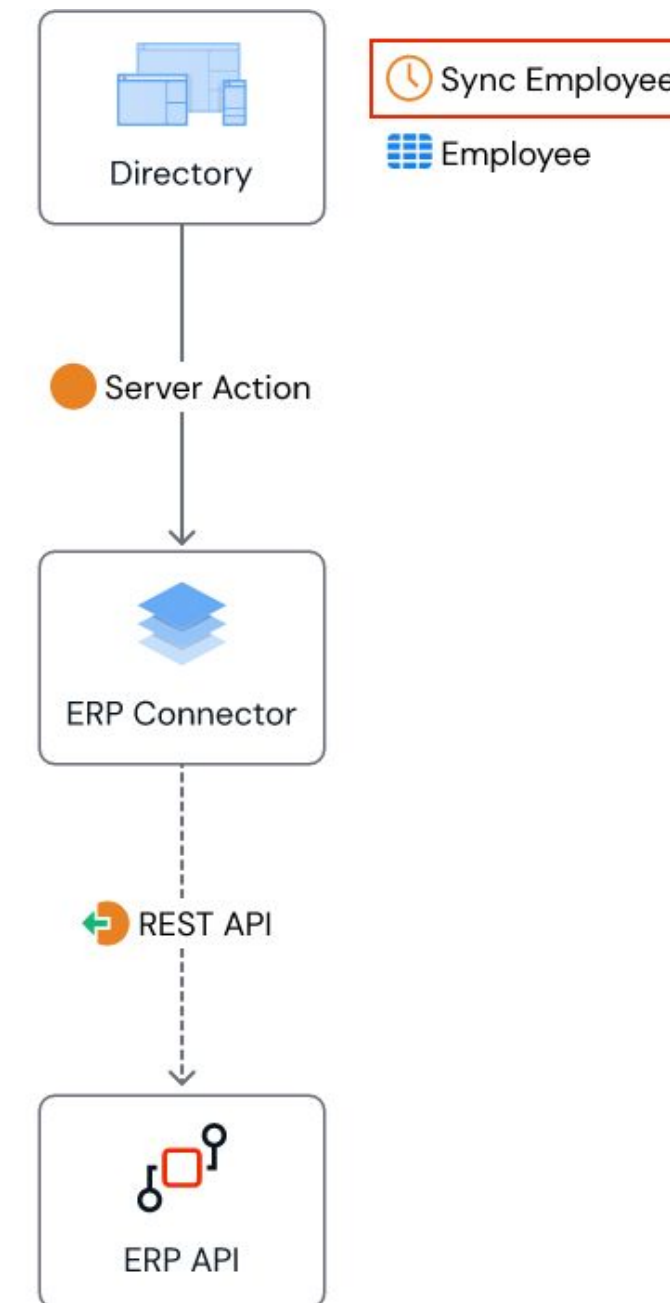

- Improves performance and scalability
- Use cases need to cope with some delay on data updates
- Synchronization logic can be optimized
 - Using built-in Actions

Integration with Cold Cache

If possible, only synchronize the new, updated or deleted records

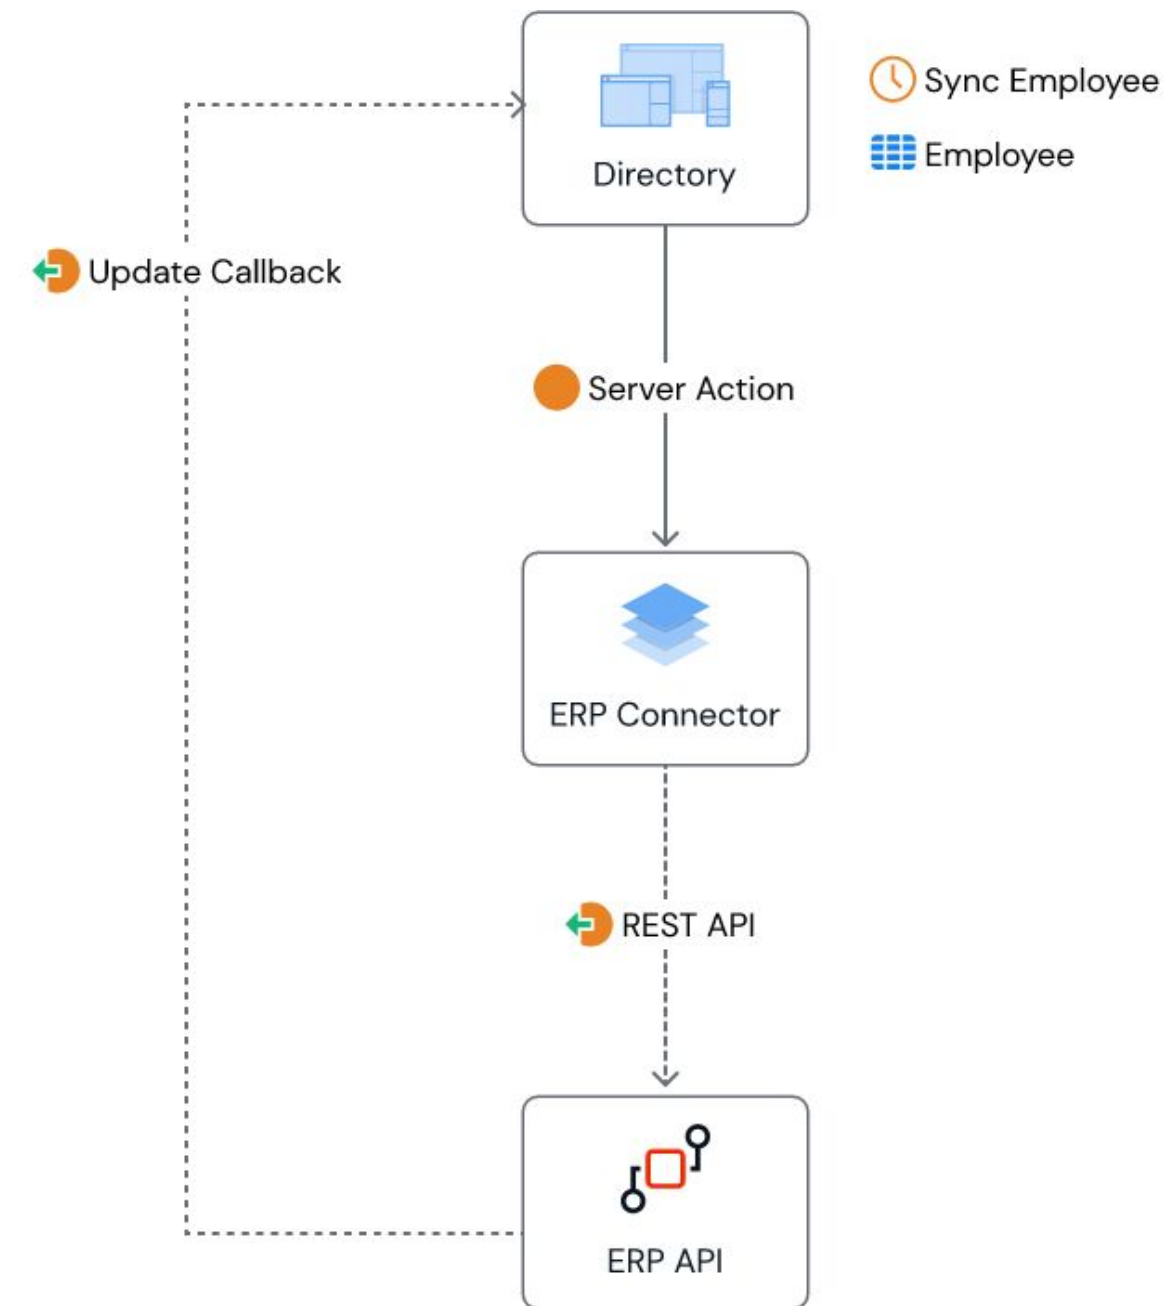

- Increases performance
- Allows more frequent updates
- Requires API support

Integration with Cold Cache and Real-Time Sync

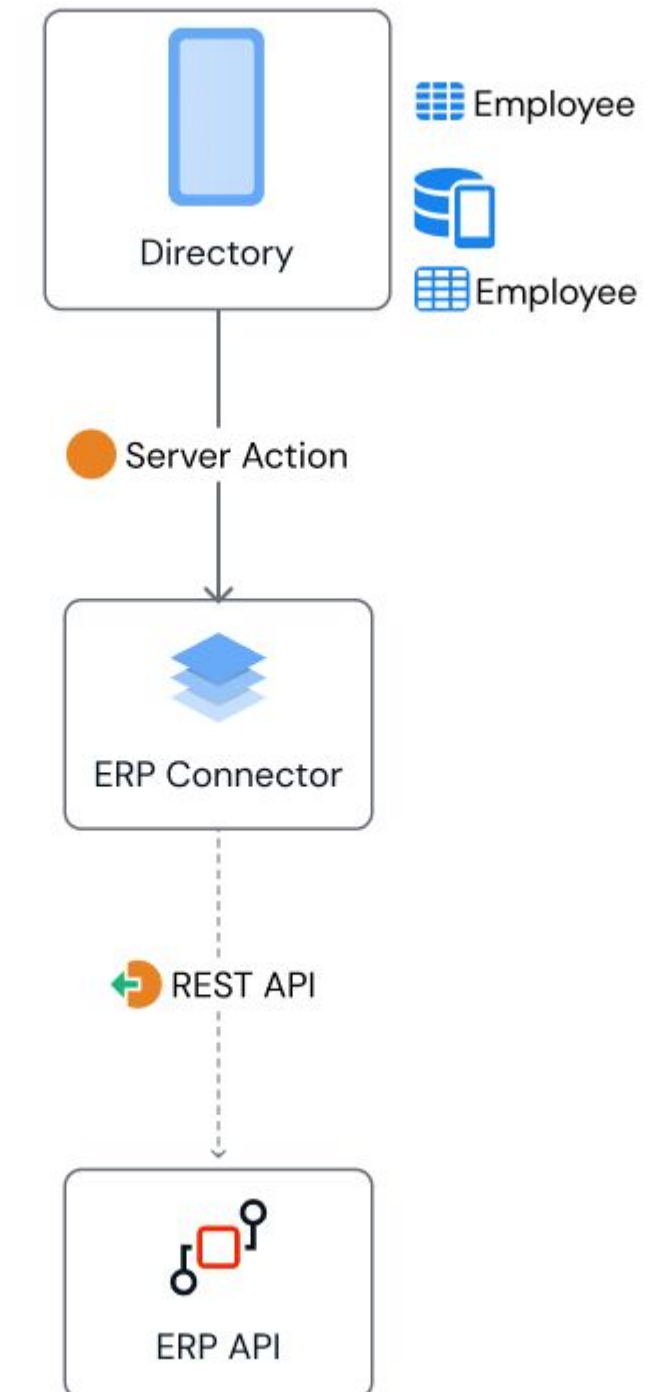

Real-time synchronization

- Callback to a REST Endpoint
- External system triggers synchronization
- Eliminates frequent polling

Mobile Sync Offline Data

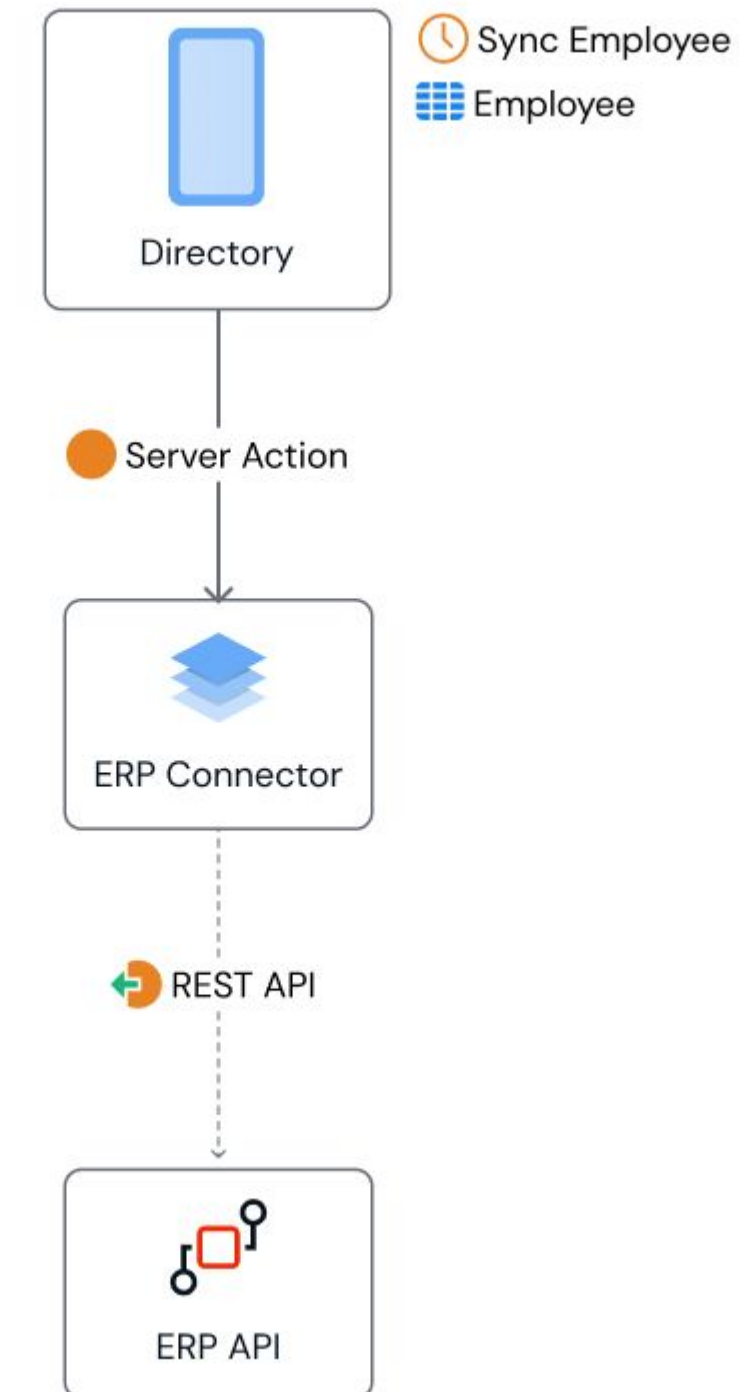

Using Client Entities to support offline capabilities

Mobile Sync Offline Data

Using Client Entities to support offline capabilities

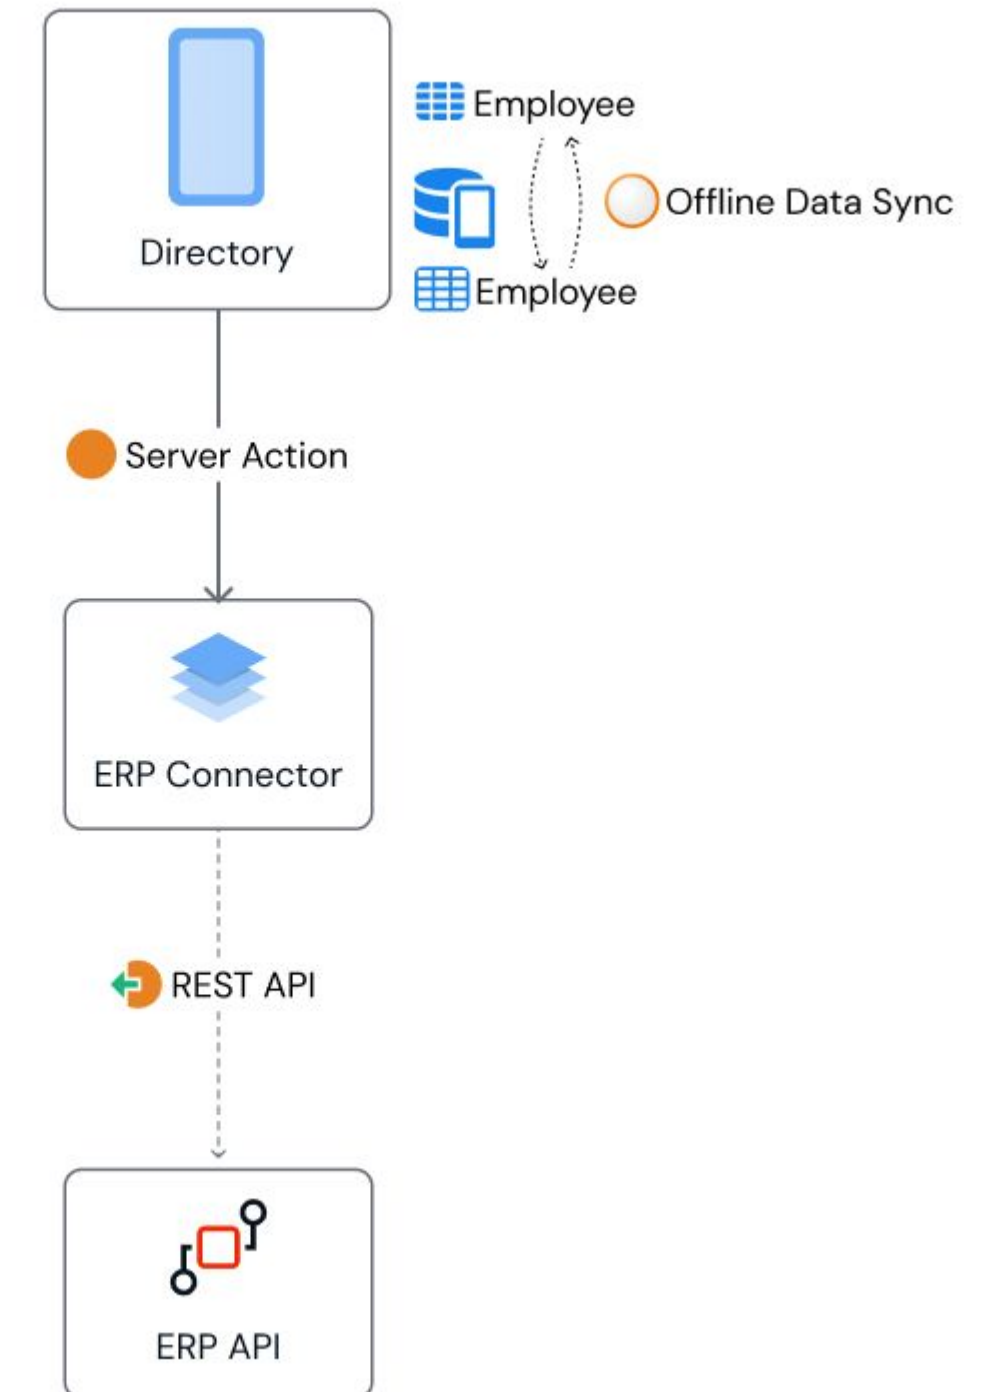

- Integration with cold cache between the connector and the mobile app

Mobile Sync Offline Data

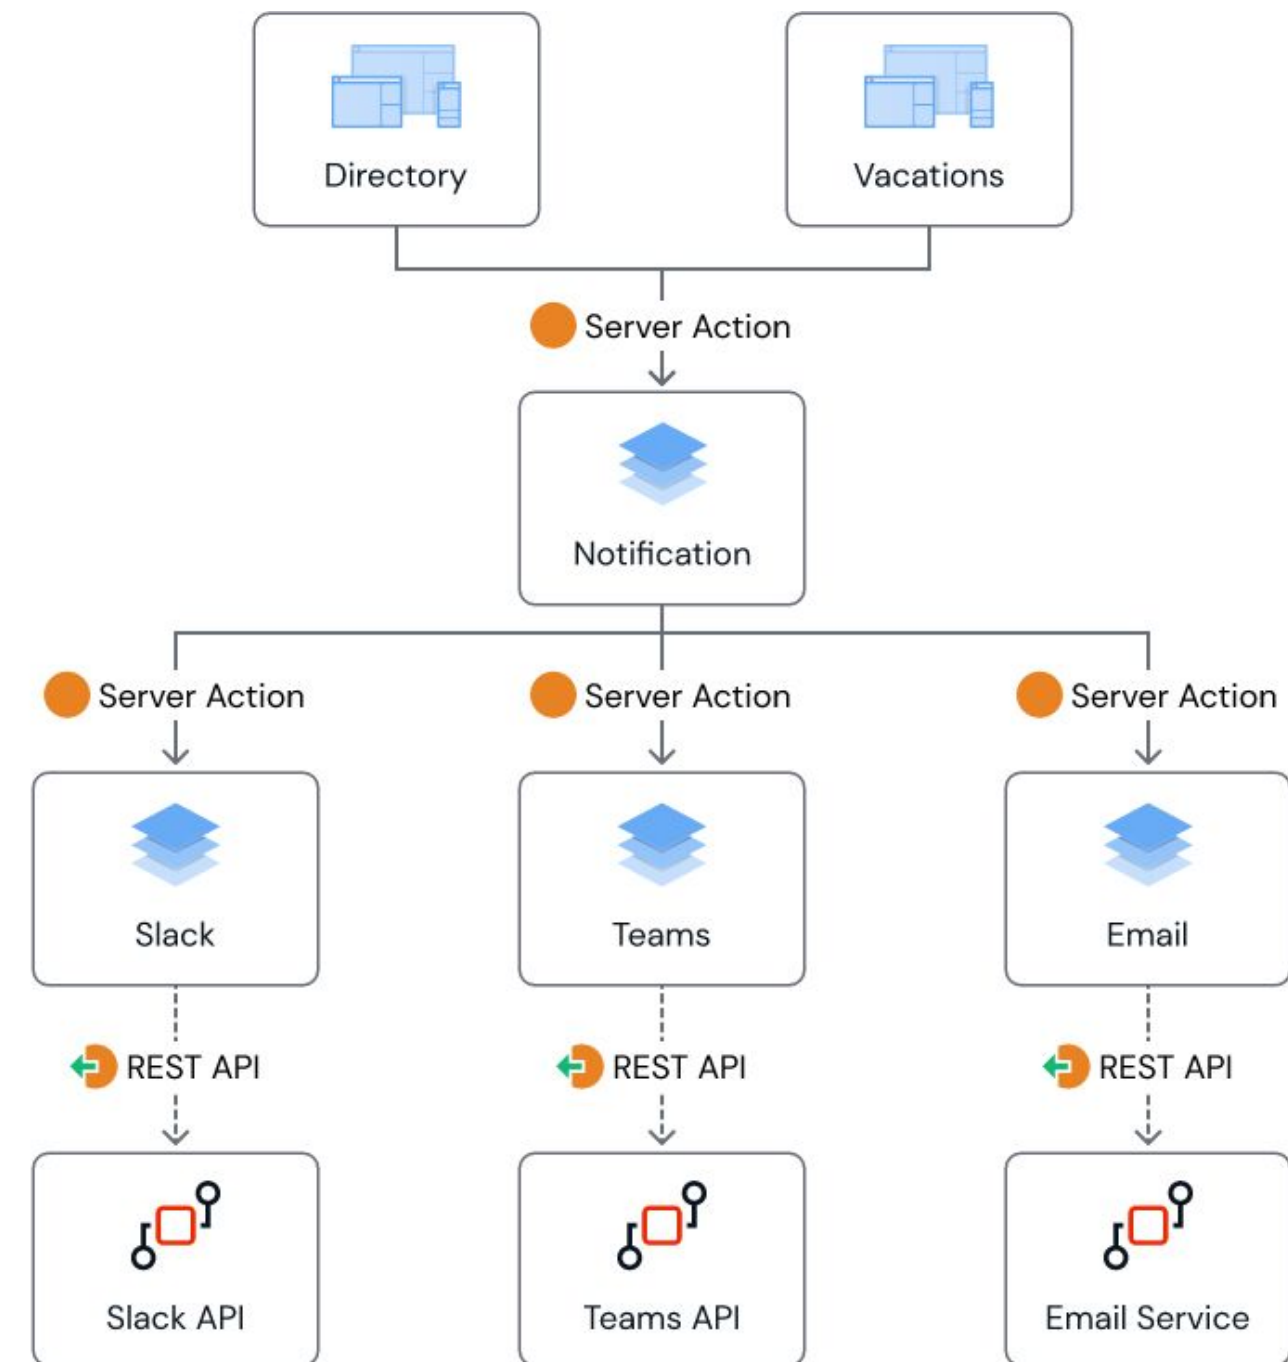

Using Client Entities to support offline capabilities

- Integration with cold cache between the connector and the mobile app
- OfflineDataSync triggers the sync process on the device

Transparency Service Pattern

- Abstracts several implementations into a single service
- Makes it easier to add more implementations
 - Less impact for consumers

Transparency Microservice Pattern

- Use an App instead of Library
- Entities to store information
- Independent runtime
