

Distributed Transactions Patterns

ODC Architecture: Service Actions and Events
Orchestration Pattern
Choreography vs Orchestration

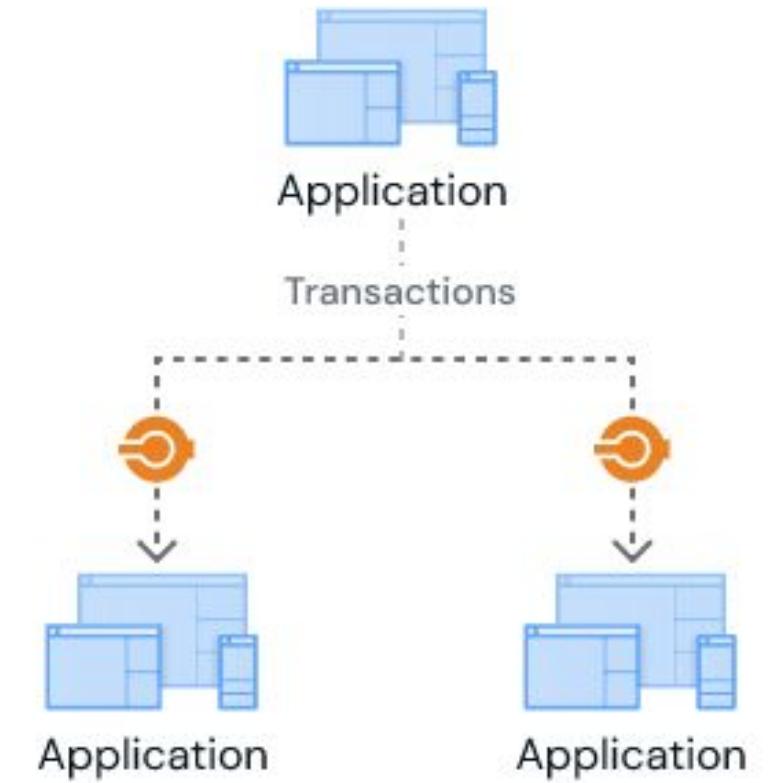

ODC Architecture - Service Actions

Loosely coupled apps

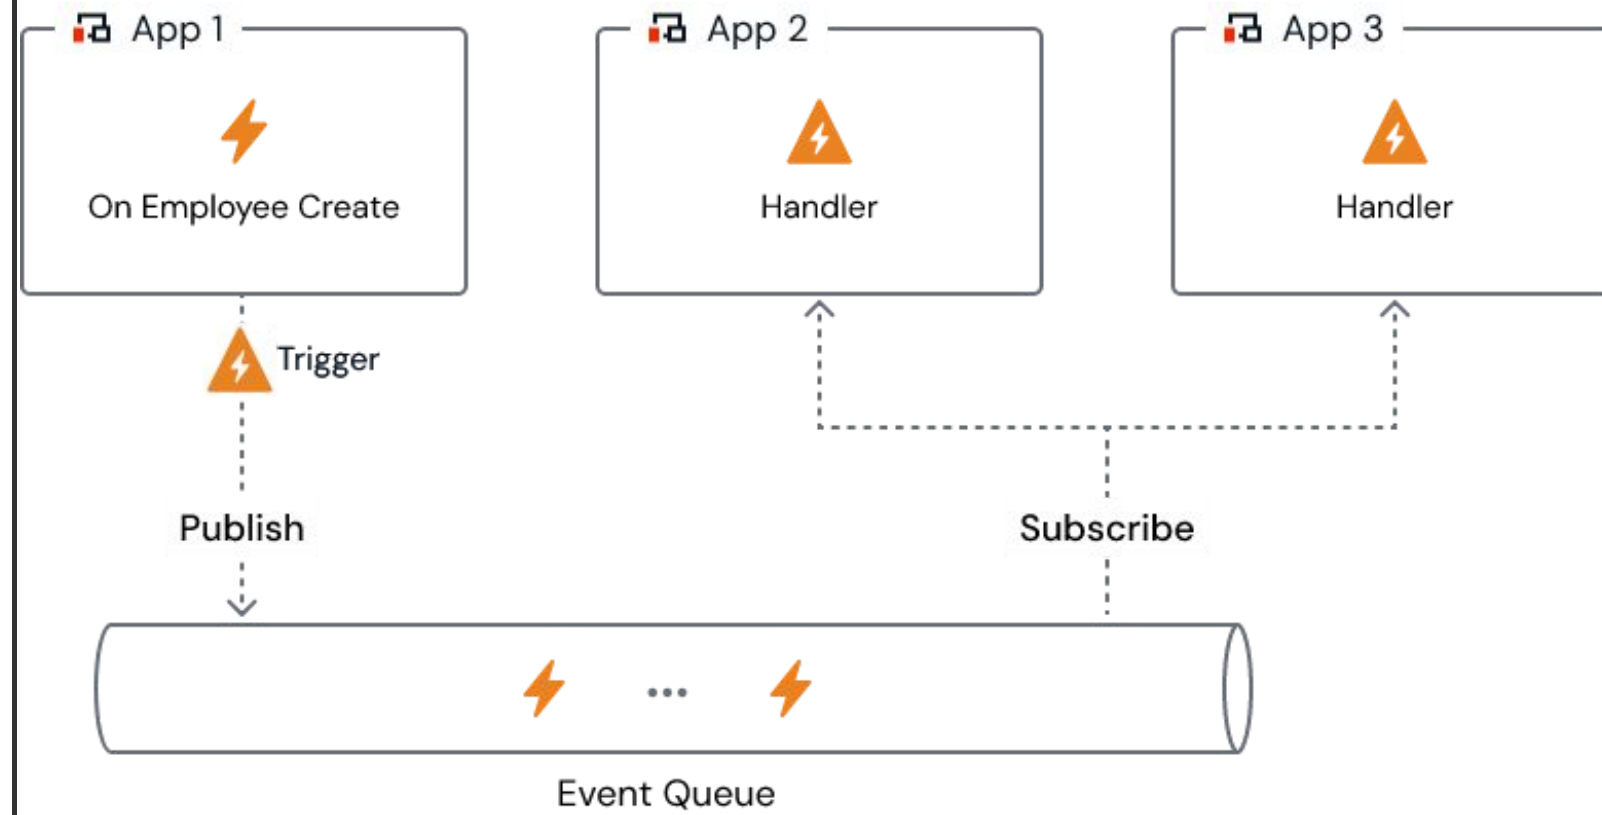

Each Service Action is
a transaction

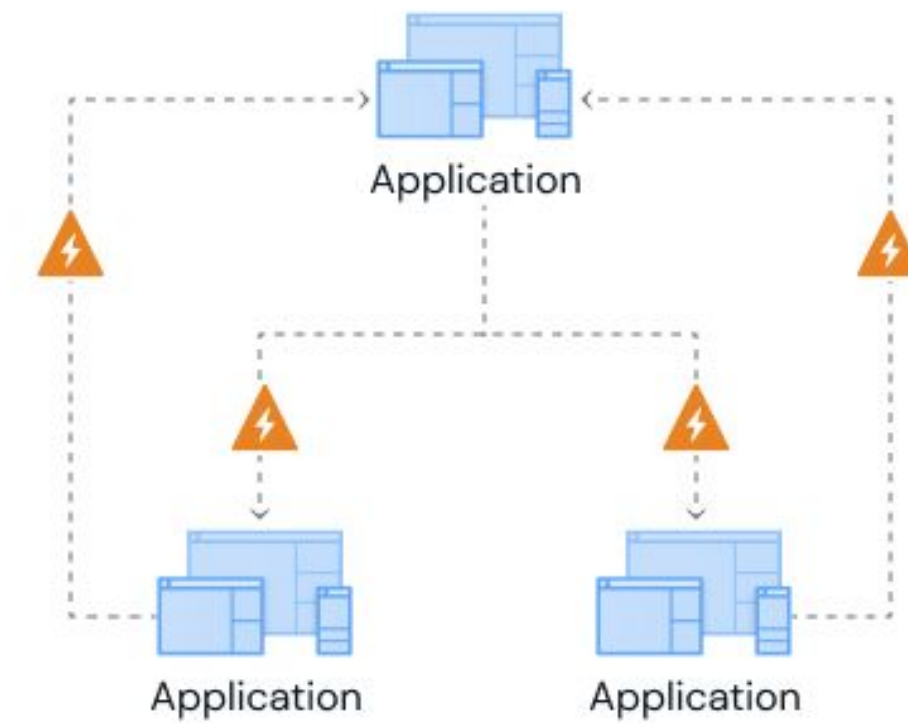

Handle multiple
transactions

ODC Architecture - Events

Publish/Subscribe
Asynchronous Events

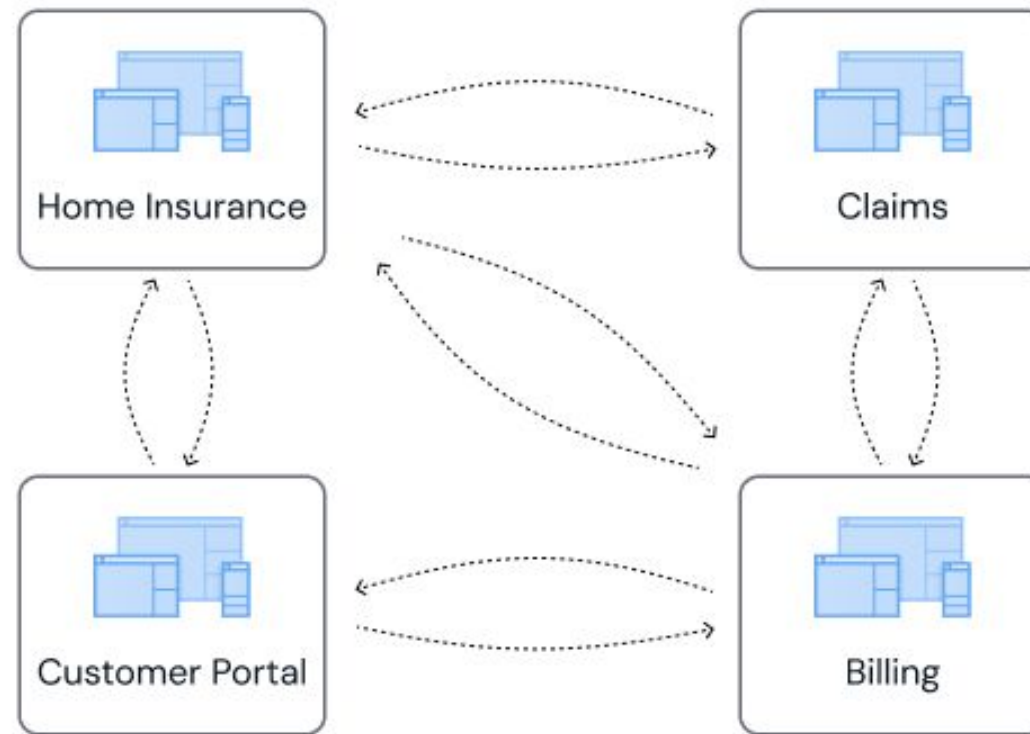

Handle multiple
transactions

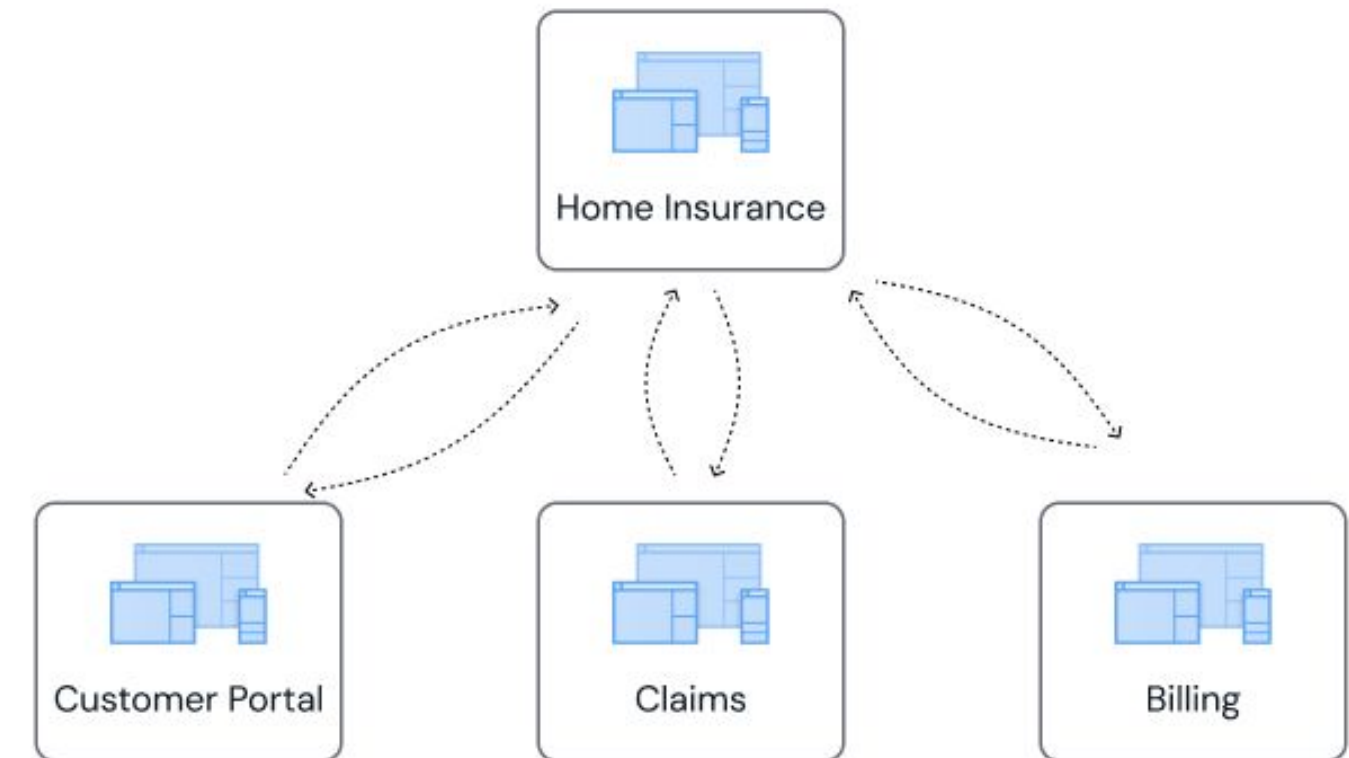

Saga Orchestration Pattern

Way to manage **data consistency** in distributed transactions scenarios by providing **transaction management**.

Choreography vs Orchestration

- Harder to test and troubleshoot
- Complex distributed transactions and fault tolerance scenarios
- New steps may require changing several apps

- Apps are more loosely coupled
- Distributed transactions and fault tolerance are orchestrated in one app
- New steps only require changes in the orchestrator
